Year / Semester	1st Year – 1st Semester
Section	CSD1
Subject / Course	Web Development
Faculty Name	Prathap Sir
Academic Year	2026–2030

Academic Year 2026–2030

Contents and Assignment Overview

Assignment Topics

This practical assignment covers the design of the following website interfaces using HTML and CSS:

No.	Website interface	Scope
1	Online Food Ordering Website	Restaurant details, menu categories, food images, prices, special offers, customer reviews and order buttons. The interface uses card layouts, attractive backgrounds and mobile-friendly navigation.
2	Bakery and Cake Shop Website	Cakes, pastries, cookies, custom cake designs, product prices, seasonal offers, store contact details and an image gallery. The design uses a visually appealing colour scheme.
3	Doctor Appointment Booking Interface	Doctor profiles, specializations, consultation timings, available appointment slots and patient registration fields. The interface focuses on clear form labels and easy navigation.

Learning Objectives

- Understand the basic structure of an HTML document.
- Use HTML elements such as headings, paragraphs, images, links, sections, forms, labels and input fields.
- Apply CSS to colours, backgrounds, fonts, spacing, borders, shadows and alignment.
- Organize website content using sections and card-based layouts.
- Create simple navigation links between sections of a webpage.
- Design pages that adapt to different screen sizes using CSS media queries.
- Practise creating, saving and running HTML files in a code editor and web browser.
- Understand how website interfaces support product displays and appointment-form entry.

Software and Technology Used

Tool / Technology	Purpose
Visual Studio Code	Code editor used to write and edit HTML and CSS code.
HTML5	Used to create webpage structure, headings, paragraphs, images, navigation, sections and forms.
CSS3	Used to style webpages with colours, layouts, cards, spacing, borders and responsive rules.
Web browser	Google Chrome or another modern browser used to open and test the webpages.
Live Server (optional)	A Visual Studio Code extension that opens a webpage in a browser and refreshes it when the file is saved.
Internet connection	Required to load externally hosted sample images used in the webpages.

Implementation Approach

1. Create one HTML file for each case study.
2. Write the page structure inside the HTML body.

3. Place CSS rules inside a style element in the head section.
4. Use image elements for product and doctor pictures.
5. Use cards and sections to group related information.
6. Add navigation links that move to page sections using element IDs.
7. Add a media query to adjust the layout on smaller screens.
8. Save the files and test them in a web browser.

CASE STUDY 01

Online Food Ordering Website

Crave Corner

Problem Statement

Design an online food-ordering interface for a restaurant. The webpage should display restaurant details, menu categories, food images, prices, special offers, customer reviews and order buttons. It should use card layouts, attractive backgrounds and mobile-friendly navigation.

Objectives

- Create a restaurant homepage named Crave Corner.
- Display menu categories such as pizza, burgers, pasta, healthy bowls, desserts and drinks.
- Show food images, descriptions and prices using product cards.
- Highlight a special discount and coupon code.
- Display customer reviews and restaurant contact information.
- Create navigation links and a responsive layout for mobile screens.

Technologies Used

HTML5 is used to create the header, navigation, menu categories, food cards, offer area, customer reviews and contact section. CSS3 is used for the colour theme, card layouts, spacing, shadows, buttons, image sizing, CSS Grid and responsive media queries. Sample food photographs are referenced from external image URLs and require an internet connection.

Features Implemented

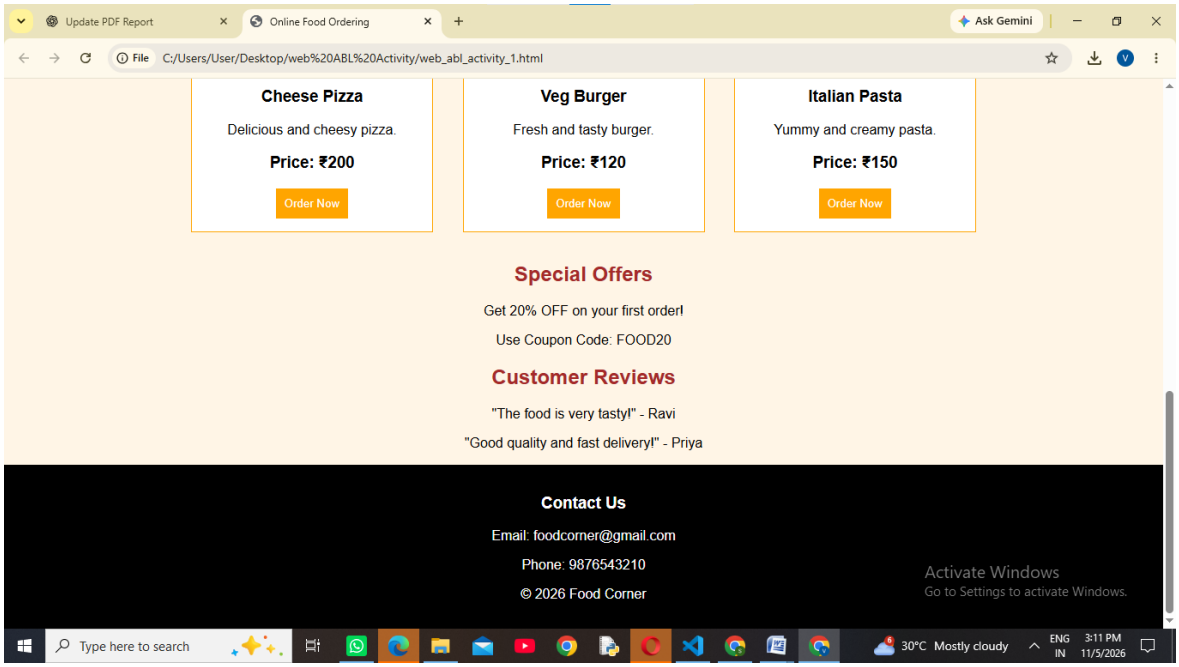

- Restaurant header with the Crave Corner name and navigation links.
- Welcome banner with an Explore Menu link and food image.
- Menu categories for Pizza, Burgers, Pasta, Healthy Bowls, Desserts and Drinks.
- Three food cards: Margherita Pizza (₹249), Cheese Burger (₹179) and White Sauce Pasta (₹219).
- Food photographs, short descriptions, prices and Order Now buttons.
- Special offer: 20% off the first order above ₹399 using coupon code CRAVE20.
- Three customer review cards with star ratings.
- Contact details and footer.
- Responsive design using CSS media queries for tablets and mobile screens.

Implementation

An HTML5 document is created with the title “Crave Corner | Online Food Ordering”. The page is divided into a header, navigation bar, hero section, categories section, menu section, offer section, reviews section and footer. Internal CSS styles the page. CSS Grid arranges the food cards and review cards, while media queries change the number of columns on smaller screens. Navigation links use section IDs such as #menu, #offers, #reviews and #contact.

The Order Now buttons are front-end demonstration buttons. The page does not accept payments, save orders or connect to a delivery service because JavaScript and backend functionality are not included.

Screenshots of the Implemented Website

Original screenshots supplied in the report. They are retained as provided.

Case Study Conclusion

The Online Food Ordering Website demonstrates how HTML and CSS can present restaurant information and food items in an attractive, organized interface. Menu categories, product cards, prices, offers, customer reviews and contact details make the webpage easy to explore. Responsive CSS improves usability on smaller screens. Real ordering and payment would require JavaScript, a backend and a payment service.

CASE STUDY 02

Bakery and Cake Shop Website

Sweet Treats Bakery

Problem Statement

A bakery needs a simple website to display its products and provide basic store information. Customers should be able to view different cakes, pastries and cookies, read short product descriptions, check prices and see current offers. The website should present products attractively and make contact details easy to find.

Objectives

- Design a simple homepage for a bakery named Sweet Treats Bakery.
- Display different bakery products with images, names, descriptions and prices.
- Provide navigation links for the Home, Cakes, Offers and Contact sections.
- Highlight a special offer for birthday cakes.
- Display the bakery's address, phone number and email address.
- Use a responsive card layout that adjusts on smaller screens.

Technologies Used

HTML5 is used for the header, navigation bar, welcome section, product cards, offer section and contact information. CSS3 is used for the pink colour theme, product-card styling, image sizing, spacing, box shadows, rounded corners and mobile layout. Sample bakery images are loaded from image URLs and require an internet connection.

Features Implemented

- Header showing the bakery name and a short tagline.
- Navigation bar with links to the main sections.
- Welcome section with an introduction and Explore Now button.
- Product cards for Chocolate Cake, Strawberry Cake, Fresh Pastry and Cookies.
- Product images, short descriptions and prices.
- Special offer section displaying 20% off on birthday cakes.
- Contact section with address, phone number and email.
- Footer containing the bakery copyright text.
- Responsive styling using a CSS media query.

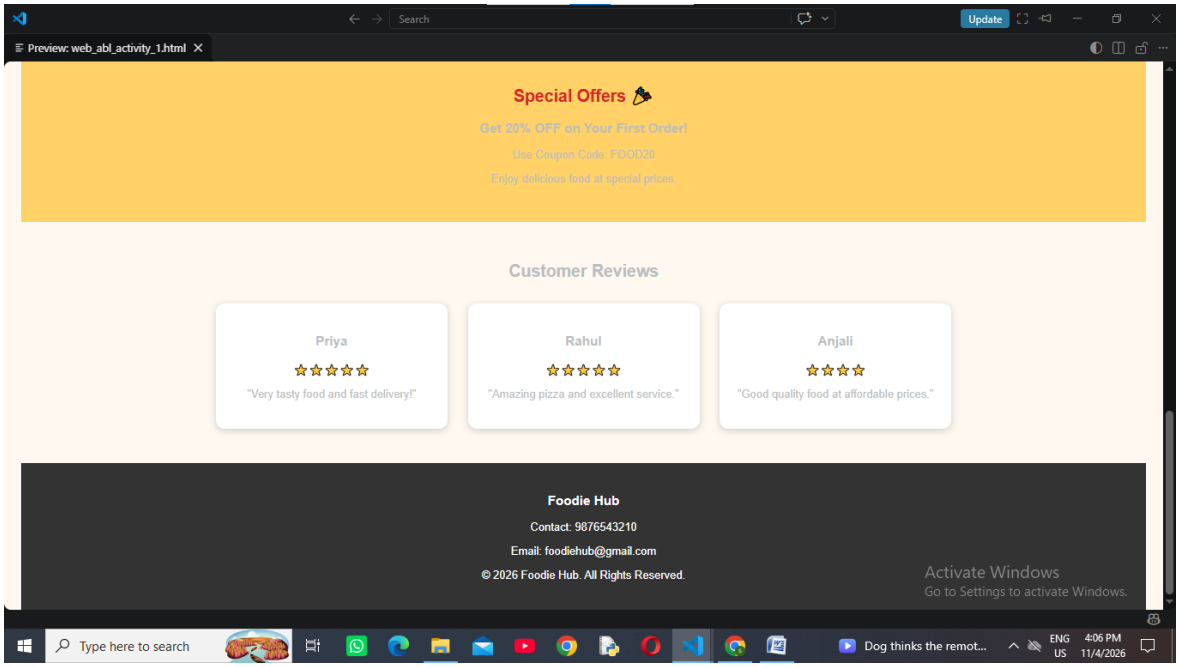

Implementation

First, an HTML document is created and the page title is set to “Sweet Treats Bakery”. A style element is added in the head section so that the HTML and CSS remain in one file. The body is divided into a header, navigation bar, welcome section, product section, offer section, contact section and footer.

The product area uses a container with the class products. Each product is placed inside a card element containing an image, product name, description, price and Order Now button. CSS Flexbox arranges the cards, while flex-wrap allows them to move to another row when the screen becomes narrower. A media query changes the card width for small screens.

Navigation links use section IDs such as #cakes, #offers and #contact. When a visitor selects one of these links, the browser moves to the matching section. The Order Now and Explore Now buttons are visual interface elements; the page does not process real orders because JavaScript or a backend service is not included.

SREENSHOT:

CASE STUDY 03

Doctor Appointment Booking Interface

HealthCare Plus

Problem Statement

Patients need a simple interface where they can view available doctors and their areas of specialization, check consultation timings and enter their details to request an appointment. The information should be clearly organized, and the appointment form should use understandable labels and suitable input fields.

Objectives

- Create a simple healthcare website named HealthCare Plus.
- Display doctor profiles with names, specializations and consultation timings.
- Provide navigation links to the Home, Doctors, Appointment and Contact sections.
- Create a patient registration and appointment form.
- Use clear labels and suitable fields for name, age, phone number and email.
- Allow the visitor to select a doctor, appointment date and preferred time.
- Use a clean blue-and-white colour theme and a responsive layout.

Technologies Used

HTML5 is used for the page structure, doctor cards, navigation links, form labels, text fields, selection lists, date input and buttons. CSS3 is used for the blue-and-white theme, card layout, form styling, input borders, spacing, shadows and responsive design. Sample doctor profile images are loaded from image URLs and require an internet connection.

Features Implemented

- Header displaying the HealthCare Plus name and tagline.
- Navigation bar with Home, Doctors, Appointment and Contact links.
- Welcome section with a Book Appointment link.
- Three doctor profile cards: Dr. Rahul (Cardiologist), Dr. Priya (Dentist) and Dr. Arjun (Neurologist).
- Consultation timings displayed on each doctor card.
- Patient Name and Age fields.
- Phone Number and Email fields.
- Doctor selection dropdown.
- Appointment date field and available-time dropdown.
- Contact details and footer.
- Responsive layout for smaller screens.

Implementation

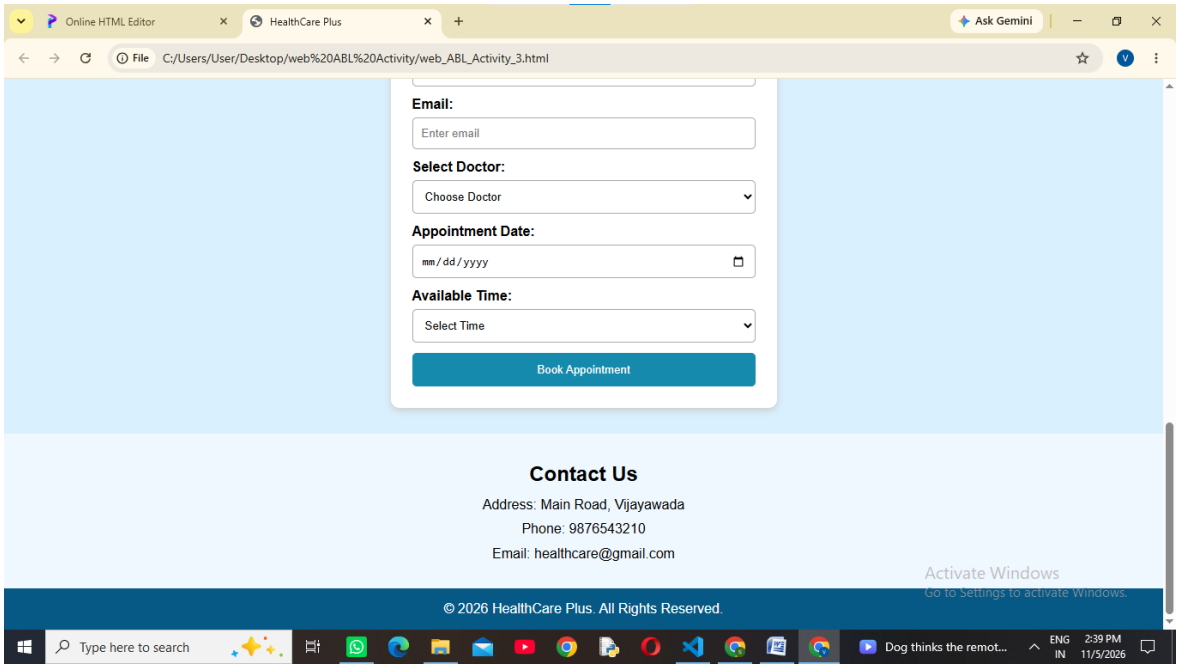

First, an HTML document is created with the title “HealthCare Plus”. CSS is written inside the style element in the head section. The webpage body contains a header, navigation bar, welcome section, doctor profiles, appointment form, contact section and footer.

The doctor profiles are arranged using a Flexbox container. Each doctor card contains a profile image, name, specialization and consultation time. The appointment area contains a form element. Labels are

placed above the corresponding input fields to make the form easy to understand. Text, number, telephone, email and date input types are used, along with select elements for doctor and time choices.

CSS is used to set the page background, card dimensions, image sizes, form width, input spacing, colours and button appearance. A media query adjusts the navigation and doctor cards on narrow screens. The form is a front-end demonstration only: without JavaScript or a backend, it does not store details, confirm appointments or check real doctor availability.

Screenshots of the Implemented Website

Original screenshot supplied in the report. It is retained as provided.

Overall Conclusion and Learning Outcomes

This assignment helped develop an understanding of how HTML5 and CSS3 can be used together to create structured, attractive and responsive website interfaces. The Bakery and Cake Shop Website presents bakery products, prices, offers and contact details. The Doctor Appointment Booking Interface presents doctor profiles and a patient appointment form. The Online Food Ordering Website presents restaurant details, menu categories, food images, prices, special offers and customer reviews.

All three webpages use navigation links, organized sections, CSS styling and responsive layout rules. They are front-end demonstrations. Real ordering, payment, appointment confirmation and data storage would require JavaScript and backend services.

Learning Outcomes

- Learned to create webpage structures using HTML5.
- Practised CSS styling, colours, backgrounds, spacing, borders and shadows.
- Used cards, Flexbox and CSS Grid to organize content.
- Added images, navigation links, buttons, form labels and input controls.
- Used section IDs to connect navigation links to webpage sections.
- Applied media queries to improve layouts on smaller screens.
- Practised testing webpages in a web browser.

Files Created

File name	Description
bakery.html	Bakery and Cake Shop Website with internal CSS.
doctor.html	Doctor Appointment Booking Interface with internal CSS.
online food ordering.html	Online Food Ordering Website with internal CSS.

Declaration

I confirm that the webpages and report have been prepared for the assigned practical work. The screenshots included in this report are rendered previews of webpages. They should be checked against the actual pages run in the student's browser.
